

# RUSH LAKE TREK GUIDE

Hoper Valley, Nagar · Gilgit-Baltistan · Pakistan

A practical field guide to the glacier approach, altitude, camps, weather, equipment, local support and responsible trekking to one of the Karakoram's highest alpine lakes.

|                  |                                            |
|------------------|--------------------------------------------|
| Maximum altitude | Rush Lake: approx. 4,694 m                 |
| Typical duration | 6-7 trekking days from Hoper               |
| Difficulty       | Challenging high-altitude trek             |
| Best season      | Late June to September                     |
| Terrain          | Glacier, moraine, scree and alpine pasture |
| Support          | Experienced local guide essential          |

Reviewed September 2026. Routes, glacier conditions, camp locations and temperatures must be reconfirmed locally before departure.

## Overview

**Rush Lake lies above Hoper Valley in Nagar District**, reached through a demanding landscape of active glaciers, unstable moraine and high alpine ground. At approximately 4,694 metres, it offers wide views towards Spantik, Miar Peak, Malubiting, Phuparash and other Karakoram summits when weather is clear. The trek is normally approached from Hoper village and should never be treated as a simple lake walk.

The route changes as glaciers and meltwater channels move. Camp names, exact elevations and walking times differ between operators. A locally experienced guide must select the safe line each season; downloaded tracks are for orientation only.

## Quick facts

|                        |                                                                |
|------------------------|----------------------------------------------------------------|
| Location               | Hoper Valley, Nagar District, Gilgit-Baltistan                 |
| Road access            | Karakoram Highway to Nagar, then Hoper village                 |
| Starting elevation     | Hoper village area: roughly 2,800 m                            |
| Highest sleeping point | Rush Lake camp: about 4,694 m                                  |
| Daily walking          | Usually 4–8 hours on rough ground                              |
| Accommodation          | Camping; guesthouse before/after                               |
| Mobile coverage        | Unreliable or absent beyond Hoper                              |
| Technical character    | Usually non-technical, but glacier conditions govern equipment |

## Altitude and acclimatisation

The height gain from Hoper to Rush Lake is close to 1,900 metres, with additional cumulative ascent and descent across moraine. Spend at least two nights around Hunza or Nagar before starting, ascend conservatively and keep a flexible schedule. Persistent headache, nausea, dizziness, unusual fatigue, breathlessness at rest or poor coordination must be reported immediately. Worsening symptoms require descent; medication never replaces acclimatisation.

### Approximate temperature planning

**Late June–July:** Hoper may reach 15–30°C by day; high camps are often around 3–16°C by day and -5 to +4°C overnight. **August:** valleys remain warm while high camps may be 4–16°C by day and -4 to +5°C at night. **September:** clearer air is common, but high-camp nights may fall to -10 to 0°C. Wind, cloud and fresh snow can make conditions colder in any month.

## A sensible 7-day trekking framework

|       |                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------|
| Day 1 | Hoper to Bericho Kor/Bualtar approach camp. Initial glacier and moraine terrain; start steadily.                                 |
| Day 2 | Approach camp to Chidin Harai. Long ascent across broken moraine and changing glacial ground.                                    |
| Day 3 | Chidin Harai to Rush Phari. Sustained climb into thinner air; the guide selects the current line.                                |
| Day 4 | Rush Lake exploration and optional viewpoint walk. Avoid a summit attempt unless specifically planned, equipped and judged safe. |
| Day 5 | Begin descent to Chidin Harai or a safer lower camp according to conditions.                                                     |
| Day 6 | Return across glacier/moraine towards Bericho Kor or Hoper approach camp.                                                        |
| Day 7 | Complete descent to Hoper; continue by road to Nagar or Hunza.                                                                   |

Some operators use six days; an extra day improves acclimatisation, weather flexibility and photography time. Walking times commonly range from four to eight hours, but glacier route-finding can extend a day.

## Guides, porters and camp support

- **Guide:** must know the current Hoper/Barpu glacier approaches, manage pace and altitude, and have authority to change or stop the route.
- **Porters:** carry group tents, food and an agreed share of guest baggage. Staffing depends on group size, equipment and fair load limits.
- **Cook/assistant:** recommended for a supported camp, particularly for safe food preparation and reliable hot drinks at altitude.
- **Emergency plan:** agree communication, first aid, evacuation limitations and decision-making before departure. Rescue is weather-dependent and cannot be guaranteed.

## Camp life, food and water

Expect basic wilderness camps, no electricity and limited privacy. Carry power banks, keep batteries warm and bring at least two litres of personal water capacity. All collected water should be boiled, filtered or treated. Supported teams normally provide breakfast, trail lunch, dinner and hot drinks; share allergies and dietary requirements before the trek. Toilets are basic and must be placed away from water and grazing areas.

## Best time

**Late June and July** usually offer the most reliable operating window, though residual snow and meltwater remain possible. **August** is warmer but glacier melt may alter channels and crossing lines. **September** often brings clearer views and fewer trekkers, with shorter days and colder nights. October to May is not the normal operating season.

## Difficulty and preparation

Rush Lake is challenging because of altitude, consecutive long days, unstable moraine, glacier travel, intense sun and cold camps. It suits trekkers with recent experience on steep, uneven trails who can walk six to eight hours with a daypack. Train with hill walking, stair climbing, leg strength and back-to-back hiking days. Trekking poles are strongly recommended.

### Essential packing

|                |                                                                                          |
|----------------|------------------------------------------------------------------------------------------|
| Footwear       | Broken-in waterproof trekking boots with strong grip; camp footwear.                     |
| Clothing       | Base layers, fleece/mid-layer, insulated jacket, waterproof shell, warm hat and gloves.  |
| Sun protection | Category-appropriate UV sunglasses, brimmed hat, high-SPF sunscreen and lip protection.  |
| Camp equipment | Sub-zero sleeping bag, insulated mat, headlamp and spare batteries.                      |
| Personal items | Daypack, bottles, personal medicines, hygiene kit, dry bags and power bank.              |
| Technical gear | Decided by the guide after a current glacier assessment; never assumed from an old list. |

## Safety essentials

- Do not attempt the glacier route independently or follow an old GPS line blindly.
- Keep the group together and follow spacing instructions on ice, moraine and exposed slopes.
- Start early when advised; heat can increase meltwater and rock movement.
- Turn back when weather, route conditions or a guest's health deteriorates.
- Insurance must explicitly cover trekking to at least 4,700 metres, emergency evacuation and the planned activities.

## Responsible trekking in Hoper Valley

The route passes through a living mountain landscape used by local communities and livestock. Use local staff under fair working arrangements, respect seasonal shelters and grazing areas, ask before photographing people, and fly drones only with clear permission. Pack out all non-biodegradable waste, keep soap and toilet waste away from water, and avoid unnecessary noise.

## Before booking

Ask who the guide is and when they last operated the route; which staff, tents, meals and baggage allowance are included; what happens if the glacier is unsafe; what emergency communication is carried; and which permits or registrations apply to your nationality and current itinerary.

## Plan with Experience Pakistan

We arrange private, carefully paced trekking journeys with local support and wider combinations across Nagar, Hunza and Upper Hunza. Share your dates, group size, trekking background and preferred comfort level.
